Messaging System

2
 3

The invention relates to the general field of sending messages from one person to another, and more specifically to messaging methodoloy and hardware for use as an introduction/dating system. In particular, the invention enables a person to send a message to another person, without having to know specifically who they are.

Background of the invention

At the present time several magazines run a dating column where a person may leave a message for an unknown person whom they have seen or encountered, in the hope that said person will see the message and respond to them. This system is unsatisfactory because of the low probability that the person to whom they wish to send the message would see the message, the low probability that they would be able to recognise that it was themselves for whom it was intended and the fact that because they would not see it until some time after the chance meeting, they are less likely to want to respond.

- The aim of the present invention is to allow a person to 1
- 2 send a message to a stranger whom they encounter.
- Typically, they will send an e-mail or short text message 3
- from their own mobile telephone. 4

- The invention aims to enable that message to reach the 6
- intended person and preferably to allow them to respond 7
- in a fun, safe and convenient fashion. 8

9 10

Brief summary of the invention

- The invention provides a new system, allowing people to 12
- send messages to other people who they have met in a 13
- chance encounter and whose conventional contact details 14
- (name, address, phone number, e-mail address etc.) they **II** 15
 - 16 do not have.

- According to the present invention there is provided a 18
- message pushing system for sending messages to 19
- recipients, the system comprising a database of details 20
- of individual potential recipients, telecommunications 21
- links for communicating with message sending and message 22
- receiving devices, the message pushing system being □ 23
 - adapted to receive a message from a message sending 24
 - means, the message comprising details of the intended 25
 - recipient of the message, wherein the message pushing 26
 - system compares the details of the intended recipient of 27
 - the message with the database of potential recipient's 28
 - details thereby establishing one or more members who may 29
 - be the intended recipient, the message pushing system 30
 - being adapted to transmit said message to the message 31
 - receiving means of the one or more members who may be the 32
 - 33 intended recipient.

Preferably, the details of individual potential 2 recipients include details of the individual's physical 3 4 appearance. The details may be selected from a list comprising their sex, their hair length and colour, their 5 eye colour, their age, their skin colour, their height, 6 7 and their clothing. 8 Preferably, the database will also include the e-mail 9 address, mobile telephone number, name, address or other 10 contact details of individual potential recipients. 11 12 Preferably also, the database will also include locations 13 where the potential recipient may be. 14 The database may also contain the current location of the recipient. 15 database may also maintain a list of previous locations. 16 17 **7** 18 Preferably also, the message pushing system is adapted to allow potential recipients to update their details. 19 may be done automatically. Typically, potential 20 recipients will update their details using their message 21 22 sending means. 23 Preferably, the message pushing system allow messages to 24 be delivered to recipients without the sender of the 25 26 message knowing who the recipient is. 27 28 Typically, the comparison between the details of the 29 potential recipient and member's details on the database 30 does not need to be exact. 31

T T Ü MJ. Uī Ш # Ti Hi

The database may also include information about how close 1 a match between details is required for that message to 2 3 be sent to that potential recipient. 4 The message sending means and message receiving means may 5 6 be the same devices. 7 Typically, the message sending means and message 8 receiving means will be mobile telephones using WAP or/I-9 10. MODE. 11 The telecommunications links may comprise the internet. 12 13 The message may comprise one of an e-mail, a text 14 15 message, a visual message or a multi-media message. 16 When transmitting the message to the message receiving 17 means, the message pushing system may or may not send the 18 description of the intended recipient of the message 19 20 along with the rest of the message. 21 22 The database may be a relational database. 23 The message may be transmitted to the recipient only on 24 request from the recipient. A web site may be used to 25 26 display the message. 27 According to the second aspect of the present invention 28 there is provided a messaging system comprising a message 29 30 pushing system according to the first aspect of the present invention and a plurality of message sending and 31 message receiving means, adapted to send messages to and 32

receive message from the message pushing system.

2	According to a third aspect of the present invention
3	there is provided a method of transmitting a message to
4	one or more recipients, the method comprising the steps
5	of:
· 6	(a) creating a database of details of the appearance
7	and location of individual potential recipients for
8	messages;
9	(b) receiving messages including details of the $^\prime$
10	appearance and location of the intended recipient
11	for a message;
12	(c) comparing the details of the appearance and
13	location of the intended recipient with the details
14	stored in the database, thereby identifying one or
15	more possible intended recipients.
16	
17	Preferably, the method further comprises the step of
18	sending the message to message receiving means belonging
19	to the possible intended recipients.
20	
21	Preferably, the details of individual potential
22	recipients include details of the individual's physical
23	appearance. The details may be selected from a list
24	comprising their sex, their hair length and colour, their
25	eye colour, their age, their skin colour, their height,
26	and their clothing.
27	
28	Preferably, the database will also include the e-mail
29	address, mobile telephone number, name, address or other
30	contact details of individual potential recipients.

18

22

25

29

- Preferably also, the database will also include locations 1 2 where the potential recipient may be. The database may 3 also maintain a list of previous locations. 4 The database may also include information about how close 5 6 a match between details is required for that message to
- 7 be sent to that potential recipient. 8

9 Preferably also, the message pushing system is adapted to 10 allow potential recipients to update their details. may be done automatically. Typically, potential 11

- 12 recipients will update their details using a message 13 sending means.
- **I** 15 Preferably, the message pushing system allow messages to 16 be delivered to recipients without the sender of the **I** 17 message knowing who the recipient is.
 - 19 Typically, the comparison between the details of the 20 potential recipient and member's details on the database does not need to be exact.
 - The message sending means and message receiving means may 24 be the same devices.
 - 26 Typically, the message sending means and message 27 receiving means will be mobile telephones using WAP or I-28 MODE.
 - 30 The telecommunications links may comprise the internet. 31
 - 32 The message may comprise one of an e-mail, a text message, a visual message or a multi-media message. 33

	1	
	2	When transmitting the message to the message receiving
	3	means, the message pushing system may or may not send the
	4	description of the intended recipient of the message
	5	along with the rest of the message.
	· 6	
	7	The database may be a relational database.
	8	
	9	Brief description of the several views of the drawings
	10	·
	11	The present invention will be illustrated with reference
	12	to the following Figures in which:
	13	
	14	Figure 1 which shows a block diagram of components
ū	15	of the message pushing system; and
	16	
	17	Figure 2 shows a flow chart of the message pushing
W	18	system.
· C	19	
		Detailed description of the invention
	21	
	22	The system shown in Figure 1 comprises a central message
•	23 24	pushing system 1 having a database 2 of personal details.
	25	Members of the service would supply the following types
	26	of information, although this list is provided purely by
	20 27	way of example and additional information might be added:
	2 <i>1</i> 28	· ·
		• Name
	29	• E-Mail Address
	30	 Mobile phone number (for SMS messages)
	31	• Description Details:
	32

1 > Hair Colour - Dark, Red, Fair, etc 2 ➤ Skin Colour - Dark, Fair ▶ Length of Hair - Short, Long 3 > Eye Colour 5 > Age > Height > Any other physical attribute 7 > Clothing details 8 9 • User's locale (the city the user lives in) 10 11 Favourite locations (a list of bars, nightclubs, etc., 12 that the person frequents) 13 • User's current location (as set by the user) 14 15 The messaging system can then use this database to 16 identify recipients for messages. An example of how the 17 system would be used is as follows. 18 19 For example, a man in a nightclub could send a message to 20 the message pushing system, using their WAP enabled 21 mobile telephone, intended for a particular women he has 22 seen standing at the bar. The sender has their own 23 mobile communication device 3 and the system enables them 24 to send a message to a recipient having a mobile 25 communication device 4 via telecommunications links 5. 26 Recipients need to be members of the service in order to 27 have their details stored on the database 2. The central 28 message pushing system has access to telecommunications 29 links, the internet or other communication means for 30 communicating with mobile communication devices 3,4. 31 32 The sender begins by composing their message, which might 33 be a text message, an e-mail or multi-media message

ossess.coc

- 1 including sound or potentially even video. This message
- 2 is then sent to the central message pushing system using
- 3 their communications device. It will be clear to one
- 4 skilled in the art that many types of communications
- 5 device could be used, particularly WAP or I-MODE mobile
- 6 telephones. The communications devices 3,4 need merely
- 7 to be message sending means and message receiving means
- 8 respectively. Mobile telephone device able to function
- 9 as both message sending means and message receiving means
- 10 are preferred.

11

- 12 As well as the message to be sent, the sender would then
- 13 prepare a description of the person and location and time
- 14 at which they have seen them, for example: the town, the
- 15 name of the nightclub, a description, e.g., "tall woman,
- 16 blond, wearing a red dress" and a time when the intended
- 17 recipient was seen, which may be a particular day or more
- 18 specific time.

19

- 20 This sender's message is then transmitted by known
- 21 technology to the message pushing system. The message
- 22 pushing system then interrogates the database to
- 23 establish one, or typically several, potential recipients
- 24 for the message. The message supplied by the user can
- 25 then be transmitted directly to mobile telecommunications
- 26 units owned by the recipient.

- 28 In order to establish which potential recipient may have
- 29 been intended the system will take into account not just
- 30 their physical appearance but also the location where
- 31 they were seen and, usually, the time at which they were
- 32 seen, comparing this with potential recipient's
- 33 descriptions and information about their location or

fill fill

32

33

possible location. Only some descriptive terms need to match and appropriate database interrogation and data 2 comparison techniques are apparent to one skilled in the 3 4 art. 5 When members of the service set their own personal 6 details, they will indicate how close a match they want 7 before a message is transmitted to them. Some people 8 might like to receive a lot of messages, only a fraction 9 of which might be intended for them. Others would only 10 wish to receive a message only if it was very likely 11 12 intended for them. 13 · Messages might be sent directly to recipients, alternatively a recipient might simply be informed that 15 there is a message waiting for them at a location from it 16 can be downloaded when they wish, for example a website. 17 Alternatively, the recipient might have to check a 18 19 website to receive any messages. In the preferred embodiment, they will be notified immediately by their 20 preferred communication method. There is no reason why 21 user's could not send and receive messages from fixed 22 terminals but mobile telecommunications devices are 23 24 preferred. 25 Further information can be provided by members to help 26 27 people identify them. Importantly, the database of 28 member details 2 can be updated on demand by members, for 29 example the person might supply information as to where 30 they are going on that evening, which clubs, etc., so as 31 to improve the chances of a match. They might also

supply details of the clothing they are wearing that

particular evening or even inform the database they have

- l moved venues. In a further embodiment, it is envisaged
- 2 that with the advent of mobile telephone positioning
- 3 technology, such as mobile telephones containing global
- 4 positioning system units or other mobile telephone
- 5 locating technologies, it may be possible for member's
- 6 mobile telephones to automatically update their current
 - 7 and historic location details on the central database.

- 9 The facility by which the database can be rapidly and,
- 10 dynamically updated by members substantially increases
- 11 the probability of successfully sending the message to
- 12 the right person.

13

- 14 Once they have received the message, the recipient can,
- 15 if they wish, then reply to the sender, sending their own
- 16 message to them. The message pushing system may allocate
- 17 an alias to each sender or each sending event, enabling
- 18 messages to be returned to the correct sender.

19

- 20 The simplest type of message would be merely a very
- 21 general statement of where the person had been seen, for
- 22 example, a city and details of a particular venue, such
- 23 as a nightclub. In another embodiment, users might
- 24 supply a more detailed description, including ideas of
- 25 hair colour, what the person was wearing, their height
- 26 and other distinguishing features, in order to gain a
- 27 more accurate match.

28

- 29 Typically the above details will be stored in a
- 30 relational database, however any other type of database
- 31 known to the art, such as a object orientated database or
- 32 a file, could be used.

- 1 Figure 2 is a flow diagram illustrating the basic
- 2 procedure for determining recipients for the messages. A
- 3 sender beings by posting a message to the message pushing
- 4 system, including location and description information as
- 5 discussed above. The database then is interrogated for
- 6 user profiles matching the location and description
- 7 included with a message. If appropriate records are
- 8 found, the system sequentially identifies user's contact
- 9 details and instigates sending the message on to the user
- 10 or users identified.

- 12 It will be seen from the above description that this
- 13 system provides an highly innovative method of messaging.
- 14 A method is provided for people to send messages to
- 15 others whom they come across in a fun, convenient and
- 16 anonymous way.

17

- 18 Revenues could be generated by asking members to pay a
- 19 subscription, which is the preferred method.
- 20 Alternatively, other e-commerce techniques, such as pay-
- 21 per-message or a linking message sending/receiving to the
- 22 receipt of advertising could also be used to generate
- 23 revenue.

24

- 25 As well as the application described above, the
- 26 underlying technology and method may be used to send
- 27 messages to unknown recipients in other circumstances,
- 28 for example, to road user's by using a description of
- 29 their vehicle.

- 31 Further improvements and modifications may be made within
- 32 the scope of the invention herein disclosed.
